

ADDENDUM TO IMPINJ INC. TEST REPORT FC06-010H

FOR THE

RFID READER CORE, IPJ-R1000-USA1M

FCC PART 15 SUBPART C SECTIONS 15.209 & 15.247

TESTING

DATE OF ISSUE: MAY 23, 2008

PREPARED FOR: PREPARED BY:

Impinj Inc.

701 N. 34th Street

Seattle, WA 98103

Mary Ellen Clayton

CKC Laboratories, Inc.

5046 Sierra Pines Drive

Mariposa, CA 95338

P.O. No.: 02539 Date of test: September 17, 2007 - W.O. No.: 83127 April 28, 2008

Report No.: FC06-010I

This report contains a total of 42 pages and may be reproduced in full only. Partial reproduction may only be done with the written consent of CKC Laboratories, Inc. The results in this report apply only to the items tested, as identified herein.

ADMINISTRATIVE INFORMATION

DATE OF TEST: September 17 – **DATE OF RECEIPT:** September 17, 2007

April 28, 2008

REPRESENTATIVE: Mike Thomas

MANUFACTURER:

Impinj Inc. 701 N. 34th Street Seattle, WA 98103 TEST LOCATION:

CKC Laboratories, Inc. 5046 Sierra Pines Drive, Mariposa, CA 95338 1120 Fulton Place Fremont, CA 94539

TEST METHOD: ANSI C63.4 (2003)

PURPOSE OF TEST:

Original Report: To demonstrate the compliance of the Speedway Reader, IPJ-R1000, with the requirements for FCC part 15 Subpart B sections 15.107 & 15.109 Class B, Subpart C Sections 15.207, 15.209 &15.247 and RSS-210 devices.

Addendum A: To clarify the plot on page 21 with no new testing.

Addendum B: To demonstrate the compliance of the RFID Reader, IPJ-R1000, with partial retesting for FCC Part 15 Subpart C Sections 15.209 and 15.247 after component changes in the EUT.

Addendum C is to add limit lines to the band edge plots and revise the frequency range on page 5. **Addendum D:** To demonstrate the compliance of the RFID Reader Antenna (Brickyard), IPJ-A0400-USA; RFID Reader Antenna (Guardwall), IPJ-A0401-USA and RFID Reader Antenna (Mini-Guardrail), IPJ-A0301-USA with the requirements for FCC Part 15 Subpart C Sections 15.209 & 15.247 devices with testing of new antennas.

Addendum E: To correct sequence 7 on page 12 and sequence 6 on page 18 with no new testing. **Addendum F:** To demonstrate the compliance of the RFID Reader Core, IPJ-R1000-USA-0-01-01 with the requirements for FCC Part 15 Subpart C Section 15.247 devices. This EUT was re-tested with a cable attached. It will be professionally installed and the power output was measured at the end of the cable. Additional data from FC06-010A (Number of Hopping Channels, Dwell Time and Average Time of Occupancy) is included in this report because these sections were not affected by the re-testing.

Addendum G: To perform partial testing to demonstrate the RFID Reader Core, IPJ-R1000-USA1M still complies with the requirements for FCC Part 15 Subpart C Section 15.247 for: 1) hopping channel bandwidth and band-edge spurious for modify transmit data format (highest data rate mode only) and 2) reduced power channels. Both due to firmware changes only.

Addendum H: To correct the name of the test on page 29 and the units on page 30 with no new testing.

Addendum I: To perform new testing of the IPJ-R1000-USA1M with the Threshold Antenna to show compliance with the requirements of FCC Part 15 Subpart C Sections 15.209 and 15.247(d).

APPROVALS

Steve Behm, Director of Engineering Services

QUALITY ASSURANCE:

TEST PERSONNEL:

Joyce Walker, Quality Assurance Administrative Manager

Randy Clark, EMC Engineer

Mike Wilkinson, EMC Engineer/Lab Manager Art Rice, Senior EMC Engineer

Amrinder Brar, EMC Engineer/Lab Manager

SUMMARY OF RESULTS

| Test | Specification/Method | Results |
|----------------------------|----------------------|---------|
| | | |
| Radiated Emissions | FCC 15.209 | Pass |
| | | |
| Occupied Bandwidth | FCC 15.247(a) | Pass |
| | | |
| Dwell Time | FCC 15.247(a) | Pass |
| | | |
| Number of Hopping Channels | FCC 15.247(a) | Pass |
| | | |
| RF Power Output | FCC 15.247(b) | Pass |
| | | |
| Band Edge | FCC 15.247(d) | Pass |

CONDITIONS DURING TESTING

No modifications to the EUT were necessary during testing.

EQUIPMENT UNDER TEST (EUT) DESCRIPTION

The customer declares the EUT tested by CKC Laboratories was representative of a production unit.

EQUIPMENT UNDER TEST

RFID Reader Core EUT Power Supply

Manuf: Impinj Manuf: CUI Inc

Model: IPJ-R1000-USA1M Model: DSA-60W-20 1 24060

Serial: 40306471536 Serial: 4406

PERIPHERAL DEVICES

The EUT was tested with the following peripheral device(s):

Router <u>Laptop Computer</u>

Manuf: Lynksys Manuf: Toshiba

Model: BEFSF41 Model: PS426U-0M1538

Serial: CB900E900020 Serial: 50683063U

Router Power Supply Mouse

Manuf: Lynksys Manuf: Microsoft
Model: D12-1A Model: Intellimouse
Serial: NA Serial: 00426696

Laptop Power Supply

Manuf: Toshiba

Model: PA3201U-1ACA

Serial: 03XV10568

Page 5 of 42 Report No: FC06-010I

Equipment used for 2008 testing

EQUIPMENT UNDER TEST

Speedway UHF RFID Reader 24VDC AC Adapter

Manuf: Impinj, Inc. Manuf: CUI Inc

Model: IPJ-R1000-USA1M Model: DSA-60W-20

Serial: 40307140716 Serial: P/N: DTS240250UC-P11P-DB

Antenna

Manuf: Impinj, Inc. Model: Threshold Serial: 04-28-08

PERIPHERAL DEVICES

The EUT was tested with the following peripheral device(s):

Laptop PC

Manuf: Dell

Model: Latitude D610 Serial: 3KVZ671

> Page 6 of 42 Report No: FC06-010I

REPORT OF EMISSIONS MEASUREMENTS

TESTING PARAMETERS

TEMPERATURE AND HUMIDITY DURING TESTING

The temperature during testing was within $+15^{\circ}$ C and $+35^{\circ}$ C. The relative humidity was between 20% and 75%.

The cables were routed consistent with the typical application by varying the configuration of the test sample. Interface cables were connected to the available ports of the test unit. The effect of varying the position of the cables was investigated to find the configuration that produced maximum emissions. Cables were of the type and length specified in the individual requirements. The length of cable that produced maximum emissions was selected.

The equipment under test (EUT) was set up in a manner that represented its normal use, as shown in the setup photographs. Any special conditions required for the EUT to operate normally are identified in the comments that accompany the emissions tables.

The emissions data was taken with a spectrum analyzer or receiver. Incorporating the applicable correction factors for distance, antenna, cable loss and amplifier gain, the data was reduced as shown in the table below. The corrected data was then compared to the applicable emission limits. Preliminary and final measurements were taken in order to ensure that all emissions from the EUT were found and maximized.

CORRECTION FACTORS

The basic spectrum analyzer reading was converted using correction factors as shown in the highest emissions readings in the tables. For radiated emissions in $dB\mu V/m$, the spectrum analyzer reading in $dB\mu V$ was corrected by using the following formula. This reading was then compared to the applicable specification limit.

| | SAMPLE CALCULATIONS | | | | | | | | |
|---|---------------------|---------------|--|--|--|--|--|--|--|
| | Meter reading | $(dB\mu V)$ | | | | | | | |
| + | Antenna Factor | (dB) | | | | | | | |
| + | Cable Loss | (dB) | | | | | | | |
| - | Distance Correction | (dB) | | | | | | | |
| - | Preamplifier Gain | (dB) | | | | | | | |
| = | Corrected Reading | $(dB\mu V/m)$ | | | | | | | |

Page 7 of 42 Report No: FC06-010I

TEST INSTRUMENTATION AND ANALYZER SETTINGS

The test instrumentation and equipment listed were used to collect the emissions data. A spectrum analyzer or receiver was used for all measurements. The following table shows the measuring equipment bandwidth settings that were used in designated frequency bands. For testing emissions, an appropriate reference level and a vertical scale size of 10 dB per division were used. When conducted emissions testing was performed, a 10 dB external attenuator was used with internal offset correction in the analyzer.

| MEASURING EQUIPMENT BANDWIDTH SETTINGS PER FREQUENCY RANGE | | | | | | | | | | | |
|------------------------------------------------------------|---------------------|------------------|-------------------|--|--|--|--|--|--|--|--|
| TEST | BEGINNING FREQUENCY | ENDING FREQUENCY | BANDWIDTH SETTING | | | | | | | | |
| CONDUCTED EMISSIONS | 150 kHz | 30 MHz | 9 kHz | | | | | | | | |
| RADIATED EMISSIONS | 30 MHz | 1000 MHz | 120 kHz | | | | | | | | |
| RADIATED EMISSIONS | 1000 MHz | >1 GHz | 1 MHz | | | | | | | | |

SPECTRUM ANALYZER/RECEIVER DETECTOR FUNCTIONS

The notes that accompany the measurements contained in the emissions tables indicate the type of detector function used to obtain the given readings. Unless otherwise noted, all readings were made in the "Peak" mode. Whenever a "Quasi-Peak" or "Average" reading is listed as one of the highest readings, this is indicated as a "QP" or an "Ave" on the appropriate rows of the data sheets. The following paragraphs describe in more detail the detector functions and when they were used to obtain the emissions data.

Peak

In this mode, the spectrum analyzer/receiver readings were recorded all emissions at their peak value as the frequency band selected was scanned. By combining this function with another feature of the measuring device called "peak hold," the measuring device had the ability to measure transients or low duty cycle transient emission peak levels. In this mode the measuring device made a slow scan across the frequency band selected and measured the peak emission value found at each frequency across the band.

Quasi-Peak

When the true peak values exceeded or were within 2 dB of the specification limit, quasi-peak measurements were taken using the quasi-peak detector.

Average

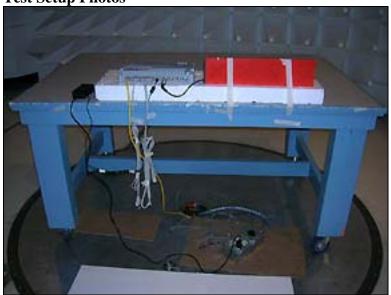

For certain frequencies, average measurements may be made using the spectrum analyzer/receiver. To make these measurements, the test engineer reduces the video bandwidth on the measuring device until the modulation of the signal is filtered out. At this point the measuring device is set into the linear mode and the scan time is reduced.

| 25A-MFN-30 | | | | |

Test Conditions

RFID reader is connected to laptop via the router. Laptop is used for configuration of the EUT. RF port 1 connected with suitable attenuation to Spectrum Analyzer via provided RF cable. Normal power mode investigated. Interrogator transmitting at max power with modulation. Reader set up in bench area.

Low Channel: 902.75 MHz Mid Channel: 914.75 MHz High Channel: 927.25 MHz

Transmitter mode is set for the highest data rate. Equipment contains other data rates with bandwidth <250 kHz. Therefore, the more stringent requirements are applied to the 15.247(a) average time of occupancy requirements.

Frequency range under investigation: 902 MHz - 928 MHz

FCC 15.247(a) DWELL TIME (Testing 2007)

Test Equipment

| Function | S/N | Calibration Date | Cal Due Date | Asset # |
|-----------------------|------------|------------------|--------------|---------|
| Agilent E4446A SA | US44300407 | 01/03/2007 | 01/03/2009 | 02660 |
| Cable, SMElectronics | 432007 | 04/23/2007 | 04/23/2009 | P05178 |
| Attenuator 30dB, Bird | 9724 | 05/09/2007 | 05/09/2009 | P01577 |
| 25A-MFN-30 | | | | |

Test Conditions

RFID reader is connected to laptop via the router. Laptop is used for configuration of the EUT. RF port 1 connected with suitable attenuation to Spectrum Analyzer via provided RF cable. Both normal power and low power modes investigated. Interrogator transmitting at max power with modulation. Reader set up in bench area

Mid Channel: 914.75 MHz

Frequency range under investigation: 902-928MHz

The analyzer is set to video trigger at 20dB below the carrier output level.

Low power mode:

The low power mode dwell time varies depending on the number of low power channels chosen.

The minimum number of low power channels allowed by the manufacturer is 2 in which the following is measured: There is a pulse train repetition which repeats approximately every 10.28 seconds. There are therefore 1.946 pulse trains per 20 second window. There are 20 individual pulses per pulse train. Each individual pulse has an average duration of 10.056ms. The pulses were averaged using video trace averaging over 200 samples. Therefore the average on time in any 20 second window is 1.946*10.056*ms*20 = 391.28ms. This satisfies the 400ms on time requirement in any 20 second window.

The maximum number of low power channels allowed by the manufacturer is 16 in which the following is measured: There is a pulse repetition which repeats approximately every 10.18 seconds. There are two pulses which occur within the pulse train with periods of 5.3 and 4.9 seconds respectively. There are therefore 3.93 pulses per 20 second window. Each pulse has an average duration of 99.99ms. The pulses were averaged using video trace averaging over 150 samples. Therefore the average on time in any 20 second window is 3.93*99.99 = 392.96ms. This satisfies the 400ms on time requirement in any 20 second window.

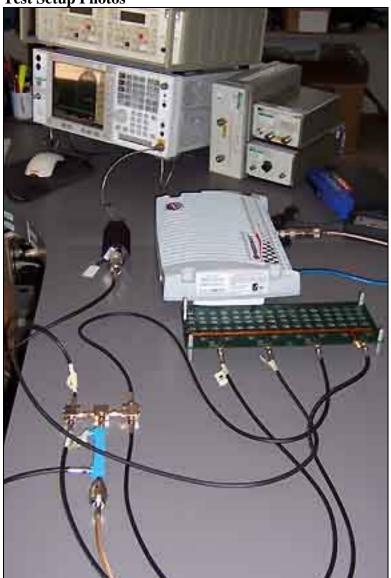

High power mode:

There is a pulse repetition which repeats approximately every 10.2 seconds. There are therefore 1.96 pulses per 20 second window. The average on time per pulse is 201.23ms (averaged over 10 pulses). Therefore the average on time in any 20 second window is 1.96*201.23 = 394.56ms. This satisfies the 400ms on time requirement in any 20 second window.

Transmitting modulated carrier at full output power, 30 dBm modulated. Low Channel: 902.75 MHz, Mid Channel: 915.25 MHz, High Channel: 927.25 MHz. Measuring transmit radiated output and -20dBc band edge compliance. RBW = 100 kHz; VBW = 300 kHz.

Transducer Legend:

| T1=ANT AN00852 25-1000MHz | T2=Cable Calibration ANP05296 |
|-------------------------------|-------------------------------|
| T3=Cable Calibration ANP05299 | T4=Cable Calibration ANP05300 |

Measurement Data: Reading listed by margin. Test Distance: 3 Meters
